

Concrete Fabrication of Distribution Box

Article Overview

Concrete distribution boxes are fabricated by preparing a compacted foundation, installing PVC pipes and masonry, reinforcing with rebar, and casting a concrete slab to ensure durable and balanced water distribution.

Foundation Preparation

Begin by excavating a minimum of 60 cm for the foundation to protect the inlet and outlet pipes. The ground must be well-compacted to provide a stable base for the masonry and concrete casting. A masonry foundation is built in the center using random rubble and 1:4 mortar, sized according to the design specifications of the distribution box ().

Pipe Installation

Install all inlet, outlet, and overflow pipes on the compacted foundation. PVC pipes should be positioned 40 cm above the top of the masonry to allow for the bottom slab casting. For outlets, ensure clean 90° cuts and use reducers for large-diameter pipes to optimize material use. A drainage tee should be installed on the inlet to facilitate cleaning operations ().

Reinforcement

Before casting the slab, place an 8 mm rebar mesh with 20x20 cm spacing around the masonry. The mesh should be tied with iron wire and positioned 3 cm above the masonry to reinforce the concrete slab. Protect the pipes from concrete ingress usi...
