

Distribution box with live wire connector

Article Overview

The live wire in a distribution box is connected to the main terminal using secure connectors, typically marked brown or red, ensuring safe and reliable power distribution.

Connecting the Live Wire

The first and most critical step in wiring a distribution box is to attach the incoming live wire (phase wire) to the main terminal of the distribution box. This wire is usually brown or red in insulation color for easy identification . The main terminal is designed to handle the full incoming current and distribute it safely to the circuit breakers or outgoing circuits.

Steps for Safe Connection

- Turn off the main power supply before starting any installation to prevent electric shock.
- Strip the insulation of the live wire to the recommended length, ensuring no exposed copper is left outside the connector.
- Insert the wire into the main terminal or live wire connector. Many modern distribution boxes use push-in or screw-type connectors that secure the wire firmly .
- Tighten the connector if using screw terminals, or ensure the wire clicks into place for push-in types. Loose connections can cause overheating or arcing.
- Connect outgoing circuit wires to their respective breakers, ensuring each wire is correctly marked and routed according to the electrical load .
- Verify connections using a multimeter to check for continuity and absence of short circuits before restoring power....
