

Does China Unicom fiber optic internet not require a router

Article Overview

China Unicom's latest fiber optic services, including FTTR and Wi-Fi 6/5G base station routers, can provide high-speed internet without requiring a traditional router.

FTTR (Fiber to the Room) Technology

China Unicom has deployed FTTR (Fiber to the Room) solutions, which extend fiber directly to each room in a home or office. These systems use ONT (Optical Network Terminal) units that integrate Wi-Fi capabilities, often replacing the need for a separate router. The FTTR devices, such as Huawei's OptiXstar F30 and B30, support ultra-gigabit speeds, low latency, and multiple device connections, providing a seamless network experience without traditional router cabling .

Wi-Fi 6 and Base Station Direct Connection

China Unicom also offers Wi-Fi 6 routers with CPE base station direct connection technology, which can receive signals directly from 4G/5G base stations. These devices allow users to access high-speed broadband without a wired network connection, making them ideal for renters, older residential communities, or mobile office setups. Users simply insert a SIM card and power on the device to create a home or office Wi-Fi network, effectively bypassing the need for a conventional router .
