

Dominican Republic Pipeline Distribution Box Specifications

Article Overview

Pipeline distribution boxes in the Dominican Republic, particularly along the Eastern Gas Pipeline, are integrated into 10-block valve stations designed for safety, monitoring, and solar-powered operation.

Overview

The Eastern Gas Pipeline (Gasoducto del Este) spans approximately 52 kilometers, transporting natural gas from AES Andrés LNG Terminal to power plants in Boca Chica and San Pedro de Macorís, Dominican Republic . Along this route, 10-block valve stations serve as the primary distribution and safety points, functioning similarly to pipeline distribution boxes.

Design and Functionality

- **Purpose:** These distribution boxes or block valve stations are designed to isolate sections of the pipeline in case of leaks, natural disasters (earthquakes, floods, hurricanes), or maintenance needs .
- **Components:** Each station includes valve actuators, instrumentation, SCADA systems, security, and telecommunications equipment. These components ensure real-time monitoring and control of gas flow.
- **Power Supply:** The stations operate 95% on photovoltaic (PV) energy, with battery banks ranging from 500 Ah to 2000 Ah and PV panel capacities from 6 kWp to 17.8 kWp, ensuring continuous operation even during grid outages
