

EU supplies fire-resistant cable trays

Article Overview

Fire-resistant cable trays in the EU are designed to maintain circuit integrity during fires, ensuring critical electrical systems remain operational for 30-90 minutes, tested according to standards like DIN 4102-12 and EN 1363-1.

Overview

Fire-resistant cable trays are essential in buildings and industrial facilities to protect vital electrical systems such as fire alarms, emergency lighting, smoke extractors, and communication lines during a fire. These trays are engineered to withstand high temperatures and prevent collapse, ensuring safe evacuation and continued operation of critical systems .

Standards and Testing

- DIN 4102-12: A German standard widely used in the EU for testing fire-resistant cable trays. It requires the entire tray system, including supports and cables, to be exposed to high temperatures in an oven for 30, 60, or 90 minutes .
- EN 1363-1: European standard for fire resistance testing, used by manufacturers like Meka Pro to simulate realistic fire conditions with installed cables .
- Local Regulations: In the absence of a unified EU standard, countries like Belgium, Germany, Czech Republic, and Slovakia apply local regulations to ensure circuit integrity under fire conditions .
