

Edge banding machine main power distribution box

Article Overview

The main power distribution box of an edge banding machine manages the three-phase AC power supply, ensuring safe and reliable operation of the machine.

Power Supply Requirements

Edge banding machines typically require a 380V three-phase AC power supply at 50–60Hz, depending on the region (e.g., 50Hz in China and Ukraine) with a voltage variation within $\pm 5\%$ to ensure stable operation . The main power distribution box is designed to handle the maximum current drawn by the machine, which must be confirmed before installation to prevent overloads .

Installation and Connection

- **Cable Preparation:** A suitable cable must be run from the facility's power source to the main electrical box of the machine .
- **Professional Connection:** The main power supply should only be connected by a qualified technician after the main power is turned off to ensure safety .
- **Startup Check:** Once connected, the main power is turned on, and the operation box (POWER button) is used to verify that the machine starts correctly .

Safety Considerations

- Ensure the main power distribution box is properly grounded to prevent electrical hazards...
