

Fiber Optic Master-Slave Router Configuration

Article Overview

To configure a fiber optic master-slave router setup, connect the master router to the ONT, set the slave router in access point or bridge mode, adjust IP addresses to avoid conflicts, and ensure proper LAN/WAN connections.

Step 1: Connect the Master Router to Fiber

Start by connecting your Optical Network Terminal (ONT) to the master router using an Ethernet cable from the ONT's LAN port to the router's WAN port . Power on the master router and access its admin panel via a web browser, typically using an IP like 192.168.1.1. Enter your ISP credentials, update firmware, and configure Wi-Fi security and network name for optimal performance . Ensure the master router is fully operational before adding a slave router.

Step 2: Configure the Slave Router

The slave router extends the network and should be set to slave, access point, or bridge mode . Connect the slave router to the master router via an Ethernet cable from a LAN port on the master to a LAN port on the slave. Access the slave router's admin panel and:

- Change its IP address to a unique address within the same subnet as the master router to avoid conflicts (e.g., if master is 192.168.1.1, set slave to 192.168.1.2), .
- Disable DHCP on the slave router so the master router handles IP assignments....
