

Fiber optic cable is connected to the router but the internet speed is slow

Article Overview

Slow internet speeds on a fiber connection are often caused by an outdated or improperly configured router, Wi-Fi interference, or device limitations.

Common Router-Related Causes

- **Outdated or Inadequate Router:** Older routers may not support gigabit speeds or handle multiple devices simultaneously, limiting your fiber connection's performance. Routers with older Wi-Fi standards (Wi-Fi 4 or Wi-Fi 5) can bottleneck speeds even if your fiber plan offers 1 Gbps or higher .
- **Router Placement:** Physical obstacles like walls, metal furniture, or electronics can weaken Wi-Fi signals. Placing your router centrally and away from interference sources improves coverage and speed .
- **Network Congestion:** Multiple devices streaming, gaming, or downloading large files at the same time can overload your router. Some routers struggle to manage high traffic, causing slowdowns .
- **Device Limitations:** Older computers, smartphones, or tablets may have network cards that cannot fully utilize high-speed fiber. Ensuring your devices support gigabit Ethernet or modern Wi-Fi standards is essential .
- **Wi-Fi Interference:** Nearby networks, Bluetooth devices, and microwaves can interfere with your Wi-Fi signal, reducing effective speeds .

Steps to Fix Slow Speeds

- **Restart Your Router:** Power cycling your router can clear temporary glitches and restore speed. Unplug it for 60 seconds, then plug it back in
