

Firewall of the secondary power distribution box at the construction site

Overview

Firewalls can be used to separate high value transformers at an electrical substation in the event of a mineral oil tank rupture and ignition. The firewall serves as a fire containment wall between one oil-filled transformer and other neighboring transformers, building. Pepperl+Fuchs provides a specialized portfolio of Ex d (flameproof) and Ex tb (dust protection by enclosure) certified terminal boxes and junction boxes engineered for reliable use in explosion-hazardous areas. These sturdy solutions are certified according to global standards such as ATEX, IECEx. A construction power distribution box is an essential part of a construction site as it ensures that the power needs of all the equipment and machinery on the site are met. This applies to tower cranes, lighting, containers, and tools as well as to hydraulic power packs that supply concrete demolition. A firewall is a fire-resistant barrier used to prevent the spread of fire.
