

How to select parameters for access layer switches

Overview

When choosing access layer switches, there are many points to consider, such as port density, port speed, security, scalability, deployment and management methods, as well as cost. FortiSwitch units distribute the ports to plugs. There are eight types of ACLs. These types are standard-numbered, standard-named, standard-numbered with the sequence editing feature, standard-named with the sequence editing feature, extended-numbered, extended-named, extended-numbered with the sequence editing feature, and extended-named with. To ensure that the switches can perform tasks of the core layer or collapsed core layer, the following parameters should be checked. Forwarding Rate: The forwarding rate is an essential parameter of core switches. As the core switches are responsible for routing and switching a high amount of data. Access control allows you to permit or deny traffic based on network addresses, protocols, service ports, and other packet attributes. This guide will walk. This chapter provides details of Cisco tested access layer solutions in the enterprise data center. A Layer 2 access topology provides the following unique capabilities required in the.
