

How to test network cable speed in a network cabinet

Article Overview

You can test network cable speed by combining physical inspection, port verification, and performance testing using tools like iPerf3 or professional cable certifiers.

Step 1: Visual and Physical Inspection

Start by checking the cable for physical damage, loose connections, or improper terminations. Ensure that connectors are properly crimped and that the cable is not bent sharply or exposed to interference sources. Inspect the switch or patch panel LEDs for abnormal indicators, which can hint at speed or connectivity issues (NetAlly) .

Step 2: Verify Port Configuration

Connect the cable to the switch and endpoint device. Check that the port speed and duplex settings are correctly negotiated. On Windows, go to Settings > Network & Internet > Ethernet and look for “Link speed (Receive/Transmit)”; on macOS, check System Settings > Network > Hardware > Speed. This shows the negotiated speed between devices and can indicate if the cable is limiting performance (D-Lay Cable) .

Step 3: Performance Testing

For a more accurate measurement of cable speed:...
