

Increasing the distance of a PoE switch

Overview

Some PoE switches feature an “ Extend Mode ”, which allows the PoE transmission distance to be increased—typically up to 250 meters. This function is ideal for deploying IP cameras across large areas. In PoE (Power over Ethernet) technology, the Ethernet link between the Power Sourcing Equipment (PSE) and the Powered Device (PD) has a clearly defined maximum distance limit—100 meters (328 feet). This limitation is not arbitrary; it is defined by the IEEE Ethernet standards that govern PoE. The distance that PoE can reach depends on various factors, including cable quality, power requirements of the devices, and the PoE standard being used. The most common PoE standard, IEEE 802. The Wi-Fi access point is a PoE Powered Device (PD), and. In practical applications, if the power demand of a device exceeds the single port output capability of a PoE switch (such as 90W for PoE++), the voltage drop problem will further compress the effective power supply distance. The implicit impact of equipment performance and wire quality Switch.
