

Installation of Mobile Distribution Box

Article Overview

A mobile distribution box should be installed on a stable, accessible surface, properly grounded, with organized wiring and tested for safety before energization.

Site Selection

Choose a location close to the main power supply to minimize power loss and ensure safety. Avoid humid, corrosive, or poorly ventilated areas to prevent equipment damage and overheating. For outdoor use, select a box with an appropriate IP rating (e.g., IP66) to protect against dust, water, and UV exposure . Ensure the site allows easy access for operation, inspection, and maintenance .

Mounting and Fixing

The bottom edge of the distribution box should typically be 1.5-1.8 meters above the ground for convenient operation . Use a firm and reliable fixing method, such as mounting brackets or screws, to prevent movement or tilting due to vibration or collision. Ensure the box is level and stable before proceeding with wiring .

Wiring Specifications

- Power Off: Always turn off the main power supply before wiring .
- Wire Selection: Use high-temperature resistant copper core wires with cross-sectional areas suitable for the load current .
- Connection: Connect line to line, neutral to neutral, and ground to ground, following color coding standards
