

Location of the electrical distribution box in Bolivia

Article Overview

Electrical distribution boxes in Bolivia are typically installed at residential, commercial, and industrial sites, as well as at strategic points along the distribution network to manage and protect electricity supply.

Residential and Urban Installations

In urban areas, distribution boxes are commonly installed outside or inside homes and apartment buildings, often near the main entrance or utility area. These boxes serve as the interface between the National Interconnected System (SIN) and the household wiring, allowing for metering, circuit protection, and load management . In multi-unit buildings, each apartment may have its own distribution box connected to a central building panel.

Rural and Off-Grid Areas

In rural or isolated regions, where the off-grid system (Aislado) operates, distribution boxes are installed at community centers, small substations, or individual homes to distribute electricity from local generators or mini-grids . These boxes are essential for managing limited electricity supply and ensuring safety in areas with decentralized power generation.
