

Mobile Fiber Optic Router Retrofit Solution

Article Overview

You can retrofit fiber-optic internet to your home or mobile setup using a compatible router connected to an ISP-provided ONT, with options for high-speed Wi-Fi 6/6E or mobile 4G/5G routers.

Understanding Fiber Retrofit

Fiber-optic internet delivers data via light signals through fiber cables, offering gigabit speeds, low latency, and high reliability compared to DSL or copper-based connections . To integrate fiber into an existing network, the fiber line terminates at an Optical Network Terminal (ONT), which converts light signals into Ethernet for your router . This means you do not need a specialized modem-router; any router with a Gigabit Ethernet WAN port can be used, provided it supports the speed tier of your fiber plan .

Using Your Own Router

When retrofitting fiber with a personal router:

- Confirm ONT Installation: Ensure your ISP has installed and activated the ONT.
- Check Router Compatibility: Your router must have a Gigabit WAN port and support modern Wi-Fi standards (Wi-Fi 6 or 6E recommended) to fully utilize fiber speeds .
- Connect Router to ONT: Use an Ethernet cable from the ONT to the router's WAN port.
- Configure Settings: Adjust VLAN, DHCP, or PPPoE settings if required by your ISP
