

# Open distribution box

## Article Overview

An open distribution box is an electrical enclosure designed to safely house and organize circuit protection and power distribution components for AC/DC systems, including solar and industrial applications.

### Overview

An open distribution box serves as a central hub for electrical circuits, distributing power from a single input source to multiple outputs while ensuring safety and organization. It typically houses components such as MCBs (Miniature Circuit Breakers), MCCBs (Molded Case Circuit Breakers), SPDs (Surge Protection Devices), meters, isolators, and bus bars. These components protect against overloads, short circuits, and voltage spikes, ensuring reliable operation of electrical systems in homes, commercial buildings, industrial plants, and solar installations (SMS Engineering) .

### Construction and Materials

Open distribution boxes are often made from powder-coated steel, epoxy-coated stainless steel, or high-quality thermoplastics like polycarbonate (PC) or acrylonitrile styrene acrylate (ASA). These materials provide durability, corrosion resistance, and electrical insulation, making the boxes suitable for indoor and outdoor environments. Many boxes are rated IP54 to IP67, offering protection against dust and water ingress (Weidmüller, SMS Engineering) .
