

Precast blocks at the distribution box

Article Overview

Precast concrete blocks in distribution boxes ensure durable, level, and efficient effluent distribution from septic tanks to leach fields.

Purpose and Function

Precast blocks are used in distribution boxes (D-boxes) to evenly divide wastewater effluent from a septic tank to multiple leach field lines. Their primary function is to maintain uniform flow, preventing overloading in one section of the leach field while underutilizing another, which is critical for the long-term performance of the wastewater system (AJFoss) .

Construction and Materials

Distribution boxes are typically made from high-strength precast concrete, often rated at 5,000 psi, and use Type III high early strength cement to ensure durability and resistance to environmental stress. Precast blocks are manufactured under controlled conditions, tested according to ASTM C31 and C39 standards, ensuring consistent quality and structural integrity (AJFoss) . Some systems also use plastic blocks or H-20 rated boxes for areas under driveways or traffic loads (AJFoss) .

Sizes and Configurations

Precast distribution boxes come in various sizes and outlet configurations, ranging from small residential boxes with 5 outlets to large commercial boxes with up to 28 outlets. H-20 boxes are available in 7, 14, 18, and 24 outlet sizes for heavy-duty ap...
