

Relay protection lightning clearance setting verification

Overview

Closed-loop real-time simulation is the most reliable way to prove protective relay settings before a substation is energized. That stance matters because commissioning errors do not stay in the lab. Static secondary injection remains useful for setup checks, but it won't verify full scheme performance under source shifts, breaker. Free relay coordination and protection grading tool for power systems engineers. Visualize Time-Current Characteristic (TCC) curves on a log-log plot with IEC 60255 IDMT curves (SI, VI, EI, LTI), real-time CTI verification, fault sweep animation, and automatic TMS optimization. Supports LV to. Power system protection relays are devices that monitor and control the operation of electrical networks, such as transmission lines, transformers, generators, and motors. They detect and isolate faults, prevent damage, and maintain stability and reliability.
