

Spanish rack cold aisle explosion-proof type

Article Overview

Cold aisle containment systems can be adapted for explosion-proof environments using modular, fire-resistant materials and airflow management to protect IT equipment.

Overview of Cold Aisle Containment (CAC)

Cold aisle containment (CAC) systems are designed to enclose the cold supply air in a data center aisle, preventing it from mixing with hot exhaust air from server racks. This separation improves cooling efficiency, reduces energy consumption, and ensures consistent temperatures for IT equipment . CAC systems can be customized to fit any rack height, aisle width, or room layout, making them suitable for retrofits or new builds .

Materials and Construction

Typical CAC systems use aluminum frames and polycarbonate panels, which are lightweight, durable, and fire-resistant . For explosion-proof applications, these materials can be replaced or reinforced with metallic panels, fireproof seals, and grounding systems to prevent sparks and static discharge. Sliding or hinged doors with gasketed seals help maintain containment while providing safe access .
