

Terminal pigtail with barcode attached

Article Overview

A terminal pigtail with a barcode is a pre-terminated connector with one end ready for device connection and the other end for splicing, labeled with a barcode for identification and tracking.

What is a Pigtail Connector?

A pigtail connector is a short cable or wire with a factory-terminated connector on one end and a bare, stripped, or unterminated end on the other. In electrical applications, the bare end is spliced or connected to circuit wiring, while the connector end attaches to a device terminal, such as an outlet, switch, or access control reader. In fiber optics, pigtails are fusion-spliced to field fibers inside splice trays, providing a reliable termination method. RF pigtails use coaxial connectors for antennas or wireless devices.

Applications

- **Electrical Wiring:** Pigtails allow multiple wires to connect to a single device terminal without overcrowding, improving reliability and safety. They can include ring, fork, quick-disconnect, or bare ends depending on the termination type.
- **Fiber Optics:** Used in telecom and data centers, pigtails simplify splicing and reduce signal loss. Common types include LC, SC, ST, and FC connectors.
- **Access Control Systems:** Devices like the HID Signo 20 use pigtail connections to simplify wiring to terminals while maintaining secure and flexible installation.
- **RF and Networking:** Coaxial pigtails connect antennas, test equipment, or wireless devices, specified by impedance and frequency range
