

# The Role of Silicon Photonic Modulators

## Overview

As data rates surge beyond 400G and 800G, a new generation of Silicon Photonic Modulators (Si-Ph Modulators) has emerged to replace traditional bulk optical modulators, reshaping how data centers and telecom networks handle bandwidth and power efficiency. This article explores what silicon photonic. NB Photonics), Ghent Univ ial components in optical communication systems. How-ever, their performance is often limited by inherent electro-optic processes and imperfections in existing integrated designs, which imit their adaptability to. Silicon photonics (SiPh), a photonic integrated circuit technology that leverages the fabrication sophistication of complementary metal-oxide-semiconductor technology, is well-positioned to deliver the performance, price, and manufacturing volume for the high-speed modulators of future optical. Silicon optical technology extends beyond just lasers, offering photonic components such as, modulators, photodetectors (PDs), splitters, (de)multiplexers, and filters.
