

What causes a pigtail transmission reception delay alarm

Overview

A dirty connector tip is one of the most common causes of poor performance. Dust, fingerprints, or small chips around the ferrule surface reduce light transmission and lead to unexpected signal loss. Which are constant for given path and packet size, and which are variable?

What applications are particularly sensitive to jitter?

Those applications may apply extra buffering to smooth out jitter – why is that additional delay a problem?

- e. due to excess noise. This document explains common SONET alarms and how to troubleshoot them. StateCondition that is reported or detected. The AIS failure is declared when an AIS defect is detected at the input and still exists after the Loss Of Frame failure is declared (caused by the. This delay is caused by several factors at different stages of data transmission and is commonly called network latency. It starts when the first bit is sent. Microcoaxial "pigtails" are an invaluable tool for anyone trying to diagnose or repair RF signal path issues.
