

What material is used for the coating layer on pigtails

Overview

Acrylate coatings are commonly used because they offer flexibility and good adhesion to the glass surface. They help maintain fiber integrity during bending, pulling, or splicing operations. In the precision-driven world of fiber optic networking, where every decibel of loss and every reflection matters, the fiber optic pigtail stands as one of the most critical yet often underappreciated components. The core receives additional doping—typically with germanium—to increase its refractive index, allowing light to be guided effectively. All desired wavelengths, such as, for example, 532 nm, 808 nm, 980 nm, 1064 nm, 1310 nm, 1480 nm, and 1550 nm can be implemented. There's no gel layer to protect the fiber core. Instead, the acrylate coating keeps the core dry, even when the cable is bent or compressed.
