

What metal is best for the fiber optic splice interface

Overview

Aluminum alloy has the advantages of lightness, corrosion resistance, and high strength, which can ensure the durability and reliability of the fiber optic splice closure. Fiber optic joints or terminations - where cables are terminated - are made two ways: 1) connectors that mate two fibers to create a temporary joint and/or connect the fiber to a piece of network gear (left) or 2) splices which create a permanent joint between the two fibers (right). More durable against crushing and accidental impact. The right choice for installations where the pigtail may be exposed to physical abuse—industrial telecom rooms, outdoor-access panels, or anywhere with high foot. It is usually made of metal or plastic and includes one or more assemblies that hold the fiber in place. The ferrule extends past the connector body to slip into the coupling device. Extra strength is provided. When deploying fiber optic cabling, one of the most critical decisions is how to terminate the fiber—either by splicing or using connectors.
